Read the following passage and answer the questions that follow:

All our industries are based on some form of natural resource, and several industries are based on resources found in the forests. Our paper pulp, rayon and plywood industries, for instance, are completely dependent on forest produce. In our country. Paper is made from bamboo: and our large paper mills are using more bamboo than forest can replace. In Karnataka, the government officially allows mills to cut 1,60,000 tons of bamboo

every year, although it has been estimated that only 1,30,000 tons are replaced. This means that, if we are content to use 1,30,000 tons of bamboo for paper annually, our bamboo forests will remain in good shape, and we would be able to go on making paper indefinitely. But because we use 30,000 tons more than we should, we will soon find that we have killed off all the bamboos in the forest and we might have to stop making paper. There is another strange anomaly in the case of bamboos. While it is licensed at Re 1 per ton to the paper mills, its actual value is, naturally, much higher. In fact, for the local villagers who use bamboo to make baskets, the cost works out to about Rs. 1,000 per tone. The situation which we fear regarding paper-making and consequent depletion of bamboo forests has already come to pass in the case of tanning industry. The nut of one common terminalias is used in tanning leather. But because of overuse, there are very few trees left of this once plentiful species, and the tanning industry has had to come to a stop. One can imagine the implication for all those who depend on the industry, whether a worker or consumer.
